

# TIMELINE MEETS ACCORDION CONCEPT

The current convention for organizing a CCD is to separate data by “section” type and then within each section to list events in a table format in reverse chronological order.

The Timeline Meets Accordion Concept creates a visual connection between sections through the use of a timeline that also enables patients and physicians to view all the relevant dates for conditions, procedures, encounters/visits, medications “at a glance” on a fixed but consistent time scale. By clicking “into” each section, viewers gain more detail about each event, but always in the context of the overall time scale.

In this current implementation, the time scale is fixed. However, one can imagine adding the ability to scale time by zooming out by decades to account for someone’s whole lifespan or zooming in to a day or week view to see the details of someone who has had many issues in a short time period.
